

# Problem: How to build a multi country cloud infrastructure for a bank?

80 million customers	~7500 employees	~1800 engineers	3 countries	NU
Credit card	Bank Account	Investments	Lending	Instant payments Insurance 
250 billion HTTP requests per week	1500 deploys per week	~188B/110B messages consumed/produced per week	1000 microservices	9 Billion Weekly Datomic Write Transactions 1+ Petabyte of Storage

# Problem: How to build a multi country cloud infrastructure for a bank?

Fresh uncluttered start

# 0 - 0 - 0 - 0 - 0

#### The first milestone

- Understand the requirements for internationalization
- Learn about the pain points
- Have an iterative process
- Build playbooks

# 0 - 0 - 0 - 0 - 0

- We don't want to duplicate everything, it's hard to maintain and operate
- Data Platform, Internal Tooling and CI/CD in Brazil, serving both countries.
- Lack of clarity of what is being shared for Brazil and Mexico countries

GCP: A landing zone, also called a *cloud foundation*, is a modular and scalable configuration that enables organizations to adopt Google Cloud for their business needs. A landing zone is often a prerequisite to deploying enterprise workloads in a cloud environment.

Azure: An Azure landing zone is an environment that follows key design principles across eight design areas. These design principles accommodate all application portfolios and enable application migration, modernization, and innovation at scale. An Azure landing zone uses subscriptions to isolate and scale application resources and platform resources. Subscriptions for application resources are called application landing zones, and subscriptions for platform resources are called platform landing zones.

AWS: A landing zone is a well-architected, multi-account AWS environment that is scalable and secure. This is a starting point from which your organization can quickly launch and deploy workloads and applications with confidence in your security and infrastructure environment. Building a landing zone involves technical and business decisions to be made across account structure, networking, security, and access management in accordance with your organization's growth and business goals for the future.

#### Landing zone

 For AWS it means a multi account environment

0-0-0-0 1->2 Native

#### **AWS multi-account**

- Default security policies
- Isolation between workloads
- Multiple natural security boundaries, with explicit and intentional access only
- Scalability (AWS account limits or API rate limits)
- Minimize the impact of potential incidents

Production

Kubernetes

Kafka

Zookeeper

#### O — O — O — O — O 1->2 Xextures Xextures

#### Worldwide shared Services

- Clear boundaries for shared services, avoid coupling with any specific country
- Clarity on how changes might affect other countries

	Production
ernetes	Kubernetes
Kafka	Kafka
seeper	Zookeeper

M&As

#### Cloud infrastructure baselines

- Consistent level of maturity across all AWS accounts
- Define the standards for cloud infrastructure
- Reduce the time and complexity to have a production-ready infrastructure environment for new countries and new business acquisitions

# **Learnings and challenges**

My role and personal experience

## Influence many teams across the organization

### Make it inspiring

### Lots of people are extremely uncomfortable navigating ambiguous situations and unknowns. Make the unknown known?

Define principles

**2** Be comfortable, it's temporary

**3** Take action. Execute!

## **Execution**

Someone has to be the first to show confidence in going in a certain direction

2 Don't follow the plan

**3** Take things to the finish line

# **Formalities**

What team are you in? Who do you report to?

Make agreements

2 Know the organization

# multi-year architecture

Observing, understanding and adapting made a quite good plan Thank you! Obrigada!
